# 1 Test Settings

## 1.1 Test Settings for C28xx

- Environment: Texas Instruments CCS 12.8.1
- Compiler F28335: v16.9.5.LTS
- Compiler F28379D: v22.6.1 LTS
- Optimization: -O2
- Floating point support: fpu32 (when applicable)
- Conversion on target: float32
- All functions are loaded from RAM

## 1.2 Test Settings for dsPIC33E

- Environment: Microchip MPLABX v6.20
- Compiler: XC16 v1.70
- Optimization: -O2
- Conversion on target: float32

## 1.3 Test Settings for PIC32

- Environment: Microchip MPLABX v6.20
- Compiler: XC32 v5.10
- Optimization: -O2
- Conversion on target: float32

## 1.4 Test Settings for STM32

- Environment: STMicroelectronics STM32CubeIDE v1.19.0
- Compiler STM32F0: GNU Tools for STM32 (10.3-2021.10)
- Compiler STM32G4: GNU Tools for STM32 (13.3.rel1)
- Optimization: -O2
- Conversion on target: float32

## 1.5 Test Settings for TM4C

- Environment: Texas Instruments CCS 12.8.1
- Compiler: v16.9.4.LTS
- Optimization: -O2
- Floating point support: FPv4SPD166
- Conversion on target: float32

## **1.6 Test Settings for XMC4000**

- Environment: Infineon DAVE v4.5.0
- Compiler: ARM-GCC-49
- Optimization: -O2
- Floating point support: fpv4-sp-d16
- Conversion on target: float32

## 2 Basic

Virtual blocks to configure basic code generation, simulation and help generation settings.

## Block: CommunicatorStart (Xcos only)

---

### Description:

With a double-click on this block, the X2C Communicator will start. The Communicator will connect to Scilab via Java Remote Method Invocation (Java RMI) to enable data exchange between Scilab and X2C.

## Block: CreateDocumentation

---

### Description:

With a double-click on this block, a documentation with all relevant information about the current X2C project can be created. The document will be created in `<ProjectDir>\Doc` and will be called `ProjectDocumentation_<NameOfModel>.pdf`.

### Parameters

**User documentation:** It is possible to add user specific documentation to the project documentation. When creating the project documentation, the `X2CCode` directory is scanned for the specified tex file (`UserDoc.tex` by default). If the file is present, it will be included in the documentation.

**Test reports:** If the checkbox `Add test reports` is selected, test reports of the C-Unit tests of the used X2C blocks are added to the project documentation.

### Requirements

In order to generate a documentation in PDF-format a TeX-compiler (e.g. `MiKTeX`) has to be installed. The software tools `Doxygen` and `Graphviz` are recommended to get documentation of the C-code.

## Block: Interact (Xcos only)

---

### Description:

When double-clicked, the block executes the Scilab script *doInteraction.sci*, if available. By customizing the script, the user can execute simple tasks, e.g. setting block parameters, read parameter values, display status information, etc., repeatedly and effortlessly.

## Block: ModelTransformation (Xcos only)

---

### Description:

With a double-click on this block, the Xcos model will be analyzed. All relevant information for code generation are gathered, transfered to the Communicator and written to the model XML file.

### 3 Control

This library contains blocks for building control algorithms.

## Block: AdaptivePT1

First order low pass with adaptive cut off frequency:

$$G(s) = V/(s/(2\pi fc) + 1)$$

| Inports |                  |
|---------|------------------|
| In      | Input In(k)      |
| fc      | Cutoff frequency |

| Outports |               |
|----------|---------------|
| Out      | Output Out(k) |

| Mask Parameters |    |                                                                        |
|-----------------|----|------------------------------------------------------------------------|
| Name            | ID | Description                                                            |
| V               | 1  | Gain                                                                   |
| fmax            | 2  | Maximum frequency [Hz]<br>(not used in floating point implementations) |
| ts_fact         | 3  | Multiplication factor of base sampling time (in integer format)        |
| method          | 4  | Discretization method                                                  |

### Description:

Transfer function (zero-order hold discretization method):

$$G(z) = V \frac{1 - e^{-2\pi fc T_s}}{z - e^{-2\pi fc T_s}}$$

### Implementations:

|                |                                      |
|----------------|--------------------------------------|
| <b>FiP8</b>    | 8 Bit Fixed Point Implementation     |
| <b>FiP16</b>   | 16 Bit Fixed Point Implementation    |
| <b>FiP32</b>   | 32 Bit Fixed Point Implementation    |
| <b>Float32</b> | 32 Bit Floating Point Implementation |
| <b>Float64</b> | 64 Bit Floating Point Implementation |

### Implementation: FiP8

8 Bit Fixed Point Implementation

| Inports Data Type |      |
|-------------------|------|
| In                | int8 |
| fc                | int8 |

| Outports Data Type |      |
|--------------------|------|
| Out                | int8 |

### Implementation: FiP16

16 Bit Fixed Point Implementation

| Inports Data Type |       |
|-------------------|-------|
| In                | int16 |
| fc                | int16 |

| Outports Data Type |       |
|--------------------|-------|
| Out                | int16 |

### Implementation: FiP32

32 Bit Fixed Point Implementation

| Inports Data Type |       |
|-------------------|-------|
| In                | int32 |
| fc                | int32 |

| Outports Data Type |       |
|--------------------|-------|
| Out                | int32 |

### Implementation: Float32

32 Bit Floating Point Implementation

| Inports Data Type |         |
|-------------------|---------|
| In                | float32 |
| fc                | float32 |

| Outports Data Type |         |
|--------------------|---------|
| Out                | float32 |

## Implementation: Float64

---

64 Bit Floating Point Implementation

| Inports Data Type |         |
|-------------------|---------|
| In                | float64 |
| fc                | float64 |

| Outports Data Type |         |
|--------------------|---------|
| Out                | float64 |

**Verification: AdaptivePT1 FiP16 CPU TMS320F28335**

**Date of Test** 2026-06-19  
**Target controller** TMS320F28335

**Test case: Inport test****OK**

Inport test for Control block AdaptivePT1.

| Test results   |      |      |      |      |     |        |

## Block: D

D Controller:

$$G(s) = K_d s / (s / (2\pi f_c) + 1)$$

| Inports |                                                                                                                                   |
|---------|-----------------------------------------------------------------------------------------------------------------------------------|
| In      | Control error input                                                                                                               |
| D0      | Derivational value which is loaded during initialization. (Usually this input is connect to the In input.)                        |
| Enable  | Enable == 0: Deactivation of block; Out set to 0<br>Enable 0->1: Preload of derivational part<br>Enable == 1: Activation of block |

| Outports |               |
|----------|---------------|
| Out      | Control value |

| Mask Parameters |    |                                                                 |
|-----------------|----|-----------------------------------------------------------------|
| Name            | ID | Description                                                     |
| Kd              | 1  | Derivative Factor                                               |
| fc              | 2  | Cutoff frequency of realization low pass                        |
| ts_fact         | 3  | Multiplication factor of base sampling time (in integer format) |

### Description:

A rising flank at the *Enable* input will preload the derivational part with the value present on the *Init* input.

Transfer function (zero-order hold discretization method):

$$G(z) = K_d 2\pi f_c \frac{z - 1}{z - e^{-2\pi f_c T_s}}$$

**Developer note:** The source code of block *DLimit* is used.

### Implementations:

|                |                                      |
|----------------|--------------------------------------|
| <b>FiP16</b>   | 16 Bit Fixed Point Implementation    |
| <b>FiP32</b>   | 32 Bit Fixed Point Implementation    |
| <b>Float32</b> | 32 Bit Floating Point Implementation |
| <b>Float64</b> | 64 Bit Floating Point Implementation |

### Implementation: FiP16

16 Bit Fixed Point Implementation

| Inports Data Type |       |
|-------------------|-------|
| In                | int16 |
| D0                | int16 |
| Enable            | bool  |

| Outports Data Type |       |
|--------------------|-------|
| Out                | int16 |

### Implementation: FiP32

32 Bit Fixed Point Implementation

| Inports Data Type |       |
|-------------------|-------|
| In                | int32 |
| D0                | int32 |
| Enable            | bool  |

| Outports Data Type |       |
|--------------------|-------|
| Out                | int32 |

### Implementation: Float32

32 Bit Floating Point Implementation

| Inports Data Type |         |
|-------------------|---------|
| In                | float32 |
| D0                | float32 |
| Enable            | bool    |

| Outports Data Type |         |
|--------------------|---------|
| Out                | float32 |

### Implementation: Float64

64 Bit Floating Point Implementation

| Inports Data Type |         |
|-------------------|---------|
| In                | float64 |
| D0                | float64 |
| Enable            | bool    |

| Outports Data Type |         |
|--------------------|---------|
| Out                | float64 |

| fc              | 2  | Cutoff frequency of realization low pass                        |
| ts_fact         | 3  | Multiplication factor of base sampling time (in integer format) |

### Description:

A rising flank at the *Enable* inport will preload the derivational part with the value present on the *Init* inport.

Transfer function (zero-order hold discretization method):

$$G(z) = K_d 2\pi f_c \frac{z - 1}{z - e^{-2\pi f_c T_s}}$$

**Developer note:** The source code of this block is used for block *D*.

### Implementations:

| ts_fact         | 3  | Multiplication factor of base sampling time (in integer format) |
| method          | 4  | Discretization method                                           |

### Description:

Due to limited value range in the 8 bit fixed point implementation rather high deviations from expected output values may occur.

**Developer note:** The source code of block *TF1* is used.

### Implementations:

|                |                                      |
|----------------|--------------------------------------|
| <b>FiP8</b>    | 8 Bit Fixed Point Implementation     |
| <b>FiP16</b>   | 16 Bit Fixed Point Implementation    |
| <b>FiP32</b>   | 32 Bit Fixed Point Implementation    |
| <b>Float32</b> | 32 Bit Floating Point Implementation |
| <b>Float64</b> | 64 Bit Floating Point Implementation |

### Implementation: FiP8

| ts_fact         | 2  | Multiplication factor of base sampling time (in integer format) |

### Description:

Each fixed point implementation uses the next higher integer datatype for the integrational value storage variable.

A rising flank at the *Enable* inport will preload the integrational part with the value present on the *Init* inport.

Transfer function (zero-order hold discretization method):

$$G(z) = K_i T_s \frac{1}{z - 1}$$

**Developer note:** The source code of block *ILimit* is used.

### Implementations:

|                |                                      |
|----------------|--------------------------------------|
| <b>FiP16</b>   | 16 Bit Fixed Point Implementation    |
| <b>FiP32</b>   | 32 Bit Fixed Point Implementation    |
| <b>Float32</b> | 32 Bit Floating Point Implementation |
| <b>Float64</b> | 64 Bit Floating Point Implementation |

### Implementation: FiP16

16 Bit Fixed Point Implementation

| Inports Data Type |       |
|-------------------|-------|
| In                | int16 |
| I0                | int16 |
| Enable            | bool  |

| Outports Data Type |       |
|--------------------|-------|
| Out                | int16 |

### Implementation: FiP32

32 Bit Fixed Point Implementation

| Inports Data Type |       |
|-------------------|-------|
| In                | int32 |
| I0                | int32 |
| Enable            | bool  |

| Outports Data Type |       |
|--------------------|-------|
| Out                | int32 |

### Implementation: Float32

32 Bit Floating Point Implementation

| Inports Data Type |         |
|-------------------|---------|
| In                | float32 |
| I0                | float32 |
| Enable            | bool    |

| Outports Data Type |         |
|--------------------|---------|
| Out                | float32 |

### Implementation: Float64

64 Bit Floating Point Implementation

| Inports Data Type |         |
|-------------------|---------|
| In                | float64 |
| I0                | float64 |
| Enable            | bool    |

| Outports Data Type |         |
|--------------------|---------|
| Out                | float64 |

|---------|---------------|
| Out     | Control value |

| Mask Parameters |    |                                                                 |
|-----------------|----|-----------------------------------------------------------------|
| Name            | ID | Description                                                     |
| Ki              | 1  | Integral Factor                                                 |
| ts_fact         | 2  | Multiplication factor of base sampling time (in integer format) |

### Description:

Each fixed point implementation uses the next higher integer datatype for the integrational value storage variable.

A rising flank at the *Enable* input will preload the integrational part with the value present on the *Init* input.

Transfer function (zero-order hold discretization method):

$$G(z) = K_i T_s \frac{1}{z - 1}$$

**Developer note:** The source code of this block is used for block *I*.

### Implementations:

|                |                                      |
|----------------|--------------------------------------|
| <b>FiP16</b>   | 16 Bit Fixed Point Implementation    |

### Description:

Transfer function (zero-order hold discretization method):

$$G(z) = K_p$$

**Developer note:** The source code of block *PLimit* is used.

### Implementations:

|                |                                      |
|----------------|--------------------------------------|
| <b>FiP16</b>   | 16 Bit Fixed Point Implementation    |
| <b>FiP32</b>   | 32 Bit Fixed Point Implementation    |
| <b>Float32</b> | 32 Bit Floating Point Implementation |
| <b>Float64</b> | 64 Bit Floating Point Implementation |

### Implementation: FiP16

---

16 Bit Fixed Point Implementation

| initHandling    | 3  | Determines what the signal provided on Init input is used for   |
| ts_fact         | 4  | Multiplication factor of base sampling time (in integer format) |

### Description:

#### Preloading Integral

A rising edge at the *Enable* inport enables the controller and preloads the integral.

One may choose from two options how to preload the integral value:

- Preload the integral from the *Init* inport.
- Preload the integral such that the first output of the controller matches the current value at the *Init* inport.  
This option allows controller switching without disturbing the control.

**Note:** Each fixed point implementation uses the next higher integer data type for the integral value storage variable.

**Transfer function** (zero-order hold discretization method):

When the block is enabled, the PI controller realizes the following transfer function:

$$G(z) = K_p + K_i T_s \frac{1}{z - 1}$$

**Developer note:** The source code of block *PILimit* is used.

## Implementations:

|                |                                      |
|----------------|--------------------------------------|
| <b>FiP8</b>    | 8 Bit Fixed Point Implementation     |
| <b>FiP16</b>   | 16 Bit Fixed Point Implementation    |
| <b>FiP32</b>   | 32 Bit Fixed Point Implementation    |
| <b>Float32</b> | 32 Bit Floating Point Implementation |
| <b>Float64</b> | 64 Bit Floating Point Implementation |

### Implementation: FiP8

---

8 Bit Fixed Point Implementation

| Inports Data Type |      |
|-------------------|------|
| In                | int8 |
| Init              | int8 |
| Enable            | bool |

| Outports Data Type |      |
|--------------------|------|
| Out                | int8 |

### Implementation: FiP16

---

16 Bit Fixed Point Implementation

| Inports Data Type |       |
|-------------------|-------|
| In                | int16 |
| Init              | int16 |
| Enable            | bool  |

| Outports Data Type |       |
|--------------------|-------|
| Out                | int16 |

### Implementation: FiP32

---

32 Bit Fixed Point Implementation

| Inports Data Type |       |
|-------------------|-------|
| In                | int32 |
| Init              | int32 |
| Enable            | bool  |

| Outports Data Type |       |
|--------------------|-------|
| Out                | int32 |

### Implementation: Float32

32 Bit Floating Point Implementation

| Inports Data Type |         |
|-------------------|---------|
| In                | float32 |
| Init              | float32 |
| Enable            | bool    |

| Outports Data Type |         |
|--------------------|---------|
| Out                | float32 |

### Implementation: Float64

64 Bit Floating Point Implementation

| Inports Data Type |         |
|-------------------|---------|
| In                | float64 |
| Init              | float64 |

### Description:

#### Preloading Integral

A rising edge at the *Enable* inport enables the controller and preloads the integral.

One may choose from two options how to preload the integral value:

- Preload the integral from the *Init* inport.
- Preload the integral such that the first output of the controller matches the current value at the *Init* inport.  
This option allows controller switching without disturbing the control.

**Note:** Each fixed point implementation uses the next higher integer data type for the integral value storage variable.

**Transfer function** (zero-order hold discretization method):

When the block is enabled, the PID controller realizes the following transfer function:

$$G(z) = K_p + K_i T_s \frac{1}{z-1} + K_d 2\pi f_c \frac{z-1}{z - e^{-2\pi f_c T_s}}$$

**FiP8 bug:** When using the TI compiler the step response of the derivative part does not return to zero, but generates an overflow at zero crossing if the derivative parameter value is too high.

**Developer note:** For the fixed point implementations the source code of block *PIDLimit* is used.

#### Implementations:

|                |                                      |
|----------------|--------------------------------------|
| <b>FiP8</b>    | 8 Bit Fixed Point Implementation     |
| <b>FiP16</b>   | 16 Bit Fixed Point Implementation    |
| <b>FiP32</b>   | 32 Bit Fixed Point Implementation    |
| <b>Float32</b> | 32 Bit Floating Point Implementation |
| <b>Float64</b> | 64 Bit Floating Point Implementation |

#### Implementation: FiP8

---

8 Bit Fixed Point Implementation

| Inports Data Type |      |
|-------------------|------|
| In                | int8 |
| Init              | int8 |
| Enable            | bool |

| Outports Data Type |      |
|--------------------|------|
| Out                | int8 |

#### Implementation: FiP16

---

16 Bit Fixed Point Implementation

| Inports Data Type |       |
|-------------------|-------|
| In                | int16 |
| Init              | int16 |
| Enable            | bool  |

| Outports Data Type |       |
|--------------------|-------|
| Out                | int16 |

#### Implementation: FiP32

---

32 Bit Fixed Point Implementation

| Inports Data Type |       |
|-------------------|-------|
| In                | int32 |
| Init              | int32 |
| Enable            | bool  |

| Outports Data Type |       |
|--------------------|-------|
| Out                | int32 |

### Implementation: Float32

32 Bit Floating Point Implementation

| Inports Data Type |         |
|-------------------|---------|
| In                | float32 |
| Init              | float32 |
| Enable            | bool    |

| Outports Data Type |         |
|--------------------|---------|
| Out                | float32 |

### Implementation: Float64

64 Bit Floating Point Implementation

| Inports Data Type |         |
|-------------------|---------|
| In                | float64 |
| Init              | float64 |
| Enable            | bool    |

| Outports Data Type |         |
|--------------------|---------|
| Out                | float64 |

**Verification: PID FiP16 CPU TMS320F28379D**

Date of Test 2026-06-22  
Target controller TMS320F28379D

**Test case: Inport test****OK**

Inport test for Control block PID.

| Init    | Initial value of output Out when enabled                                                                                      |
| max     | Maximum output value                                                                                                          |
| min     | Minimum output value                                                                                                          |
| Enable  | Enable == 0: Deactivation of block; Out set to 0<br>Enable 0->1: Preload of integral part<br>Enable == 1: Activation of block |

| Outputs |               |
|---------|---------------|
| Out     | Control value |

| Mask Parameters |    |                                                                 |
|-----------------|----|-----------------------------------------------------------------|
| Name            | ID | Description                                                     |
| Kp              | 1  | Proportional Factor                                             |
| Ki              | 2  | Integral Factor                                                 |
| Kd              | 3  | Derivative Factor                                               |
| fc              | 4  | Cutoff frequency of realization low pass                        |
| initHandling    | 5  | Determines what the signal provided on Init input is used for   |
| ts_fact         | 6  | Multiplication factor of base sampling time (in integer format) |

### Description:

#### Preloading Integral

A rising edge at the *Enable* input enables the controller and preloads the integral.

One may choose from two options how to preload the integral value:

- Preload the integral from the *Init* input.
- Preload the integral such that the first output of the controller matches the current value at the *Init* input.  
This option allows controller switching without disturbing the control.

**Note:** Each fixed point implementation uses the next higher integer data type for the integral value storage variable.

**Transfer function** (zero-order hold discretization method):

When the block is enabled, the PID controller realizes the following transfer function:

$$G(z) = K_p + K_i T_s \frac{1}{z - 1} + K_d 2\pi f_c \frac{z - 1}{z - e^{-2\pi f_c T_s}}$$

### Anti Wind-Up

The implemented anti wind-up method is clamping. If the output signal out exceeds the upper or lower limit value, which is given by the inport max and the inport min, the integrator is clamped if the controller input would increase the saturation even further.

**FiP8 bug:** When using the TI compiler the step response of the derivative part doesn't return to zero, but generates an overflow at zero crossing if the derivative parameter value is too high.

**Developer note:** The fixed point implementation source code of this block is used for block *PID*.

### Implementations:

|                |                                      |
|----------------|--------------------------------------|
| <b>FiP8</b>    | 8 Bit Fixed Point Implementation     |
| <b>FiP16</b>   | 16 Bit Fixed Point Implementation    |
| <b>FiP32</b>   | 32 Bit Fixed Point Implementation    |
| <b>Float32</b> | 32 Bit Floating Point Implementation |
| <b>Float64</b> | 64 Bit Floating Point Implementation |

### Implementation: FiP8

8 Bit Fixed Point Implementation

| Inports Data Type |      |
|-------------------|------|
| In                | int8 |
| Init              | int8 |
| max               | int8 |
| min               | int8 |
| Enable            | bool |

| Outports Data Type |      |
|--------------------|------|
| Out                | int8 |

### Implementation: FiP16

16 Bit Fixed Point Implementation

| Inports Data Type |       |
|-------------------|-------|
| In                | int16 |
| Init              | int16 |
| max               | int16 |
| min               | int16 |
| Enable            | bool  |

| Outports Data Type |       |
|--------------------|-------|
| Out                | int16 |

### Implementation: FiP32

32 Bit Fixed Point Implementation

| Inports Data Type |       |
|-------------------|-------|
| In                | int32 |
| Init              | int32 |
| max               | int32 |
| min               | int32 |
| Enable            | bool  |

| Outports Data Type |       |
|--------------------|-------|
| Out                | int32 |

### Implementation: Float32

32 Bit Floating Point Implementation

| Inports Data Type |         |
|-------------------|---------|
| In                | float32 |
| Init              | float32 |
| max               | float32 |

| initHandling    | 3  | Determines what the signal provided on Init input is used for   |
| ts_fact         | 4  | Multiplication factor of base sampling time (in integer format) |

### Description:

#### Preloading Integral

A rising edge at the *Enable* inport enables the controller and preloads the integral.

One may choose from two options how to preload the integral value:

- Preload the integral from the *Init* inport.
- Preload the integral such that the first output of the controller matches the current value at the *Init* inport.  
This option allows controller switching without disturbing the control.

**Note:** Each fixed point implementation uses the next higher integer data type for the integral value storage variable.

**Transfer function** (zero-order hold discretization method):

When the block is enabled, the PI controller realizes the following transfer function: Transfer

function (zero-order hold discretization method):

$$G(z) = K_p + K_i T_s \frac{1}{z - 1}$$

### Anti Wind-Up

The implemented anti wind-up method is clamping. If the output signal out exceeds the upper or lower limit value, which is given by the inport max and the inport min, the integrator is clamped if the controller input would increase the saturation even further.

**Developer note:** The source code of this block is used for block *PI*.

### Implementations:

|                |                                      |
|----------------|--------------------------------------|
| <b>FiP8</b>    | 8 Bit Fixed Point Implementation     |
| <b>FiP16</b>   | 16 Bit Fixed Point Implementation    |
| <b>FiP32</b>   | 32 Bit Fixed Point Implementation    |
| <b>Float32</b> | 32 Bit Floating Point Implementation |
| <b>Float64</b> | 64 Bit Floating Point Implementation |

### Implementation: FiP8

### Description:

Due to limited value range in the 8 bit fixed point implementation rather high deviations from expected output values may occur.

**Developer note:** The source code of block *TF1* is used.

### Implementations:

|                |                                      |
|----------------|--------------------------------------|
| <b>FiP8</b>    | 8 Bit Fixed Point Implementation     |
| <b>FiP16</b>   | 16 Bit Fixed Point Implementation    |
| <b>FiP32</b>   | 32 Bit Fixed Point Implementation    |
| <b>Float32</b> | 32 Bit Floating Point Implementation |
| <b>Float64</b> | 64 Bit Floating Point Implementation |

### Implementation: FiP8

## Block: TDSysystemO1

---

$$\begin{aligned} \mathbf{x}_{k+1} &= \mathbf{A} \mathbf{x}_k + \mathbf{B} u_k \\ y_k &= \mathbf{C} \mathbf{x}_k + \mathbf{D} u_k \end{aligned}$$

1st order time discrete system with one input and one output.

| Inports |          |
|---------|----------|
| In      | Input #1 |

| Outports |           |
|----------|-----------|
| Out      | Output #1 |

| Mask Parameters |    |                      |
|-----------------|----|----------------------|
| Name            | ID | Description          |
| A               | 1  | State matrix A       |
| B               | 2  | Input matrix B       |
| C               | 3  | Output matrix C      |
| D               | 4  | Feedthrough matrix D |

### Description:

Calculation:

$$\begin{aligned} x_{1,k+1} &= a_{1,1}x_{1,k} + b_{1,1}u_{1,k} \\ y_{1,k} &= c_{1,1}x_{1,k} + d_{1,1}u_{1,k} \end{aligned}$$

or short

$$\begin{aligned} \mathbf{x}_{k+1} &= \mathbf{A}\mathbf{x}_k + \mathbf{B}u_k \\ y_k &= \mathbf{C}\mathbf{x}_k + \mathbf{D}u_k \end{aligned}$$

|-----------------|----|----------------|
| Name            | ID | Description    |
| A               | 1  | State matrix A |
| B               | 2  | Input matrix B |

### Description:

Calculation:

$$\begin{aligned} \begin{bmatrix} x_{1,k+1} \\ x_{2,k+1} \end{bmatrix} &= \begin{bmatrix} a_{1,1} & a_{1,2} \\ a_{2,1} & a_{2,2} \end{bmatrix} \begin{bmatrix} x_{1,k} \\ x_{2,k} \end{bmatrix} + \begin{bmatrix} b_{1,1} & b_{1,2} \\ b_{2,1} & b_{2,2} \end{bmatrix} \begin{bmatrix} u_{1,k} \\ u_{2,k} \end{bmatrix} \\ \begin{bmatrix} y_{1,k} \\ y_{2,k} \end{bmatrix} &= \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} \begin{bmatrix} x_{1,k} \\ x_{2,k} \end{bmatrix} + \begin{bmatrix} 0 & 0 \\ 0 & 0 \end{bmatrix} \begin{bmatrix} u_{1,k} \\ u_{2,k} \end{bmatrix} \end{aligned}$$

or short

$$\begin{aligned} \mathbf{x}_{k+1} &= \mathbf{A} \mathbf{x}_k + \mathbf{B} \mathbf{u}_k \\ \mathbf{y}_k &= \mathbf{x}_k \end{aligned}$$

### Implementations:

|                |                                      |
|----------------|--------------------------------------|

| ts_fact         | 4  | Multiplication factor of base sampling time (in integer format) |

### Description:

Due to limited value range in the 8 bit fixed point implementation rather high deviations from expected output values may occur.

**Developer note:** The source code of this block is used for blocks *DT1* and *PT1*.

### Implementations:

|                |                                      |

| ts_fact         | 2  | Multiplication factor of base sampling time (in integer format) |

### Description:

Each fixed point implementation uses the next higher integer datatype for the integrational value storage variable.

A rising flank at the *Enable* inport will preload the integrational part with the value present on the *Init* inport.

Transfer function (zero-order hold discretization method):

$$G(z) = K_i T_s \frac{1}{z - 1}$$

### Implementations:

|                |                                      |
|----------------|--------------------------------------|
| <b>FiP8</b>    | 8 Bit Fixed Point Implementation     |
| <b>FiP16</b>   | 16 Bit Fixed Point Implementation    |
| <b>FiP32</b>   | 32 Bit Fixed Point Implementation    |
| <b>Float32</b> | 32 Bit Floating Point Implementation |
| <b>Float64</b> | 64 Bit Floating Point Implementation |

### Implementation: FiP8

---

8 Bit Fixed Point Implementation

| Inports Data Type |      |
|-------------------|------|
| In                | int8 |
| Init              | int8 |
| Enable            | bool |

| Outports Data Type |      |
|--------------------|------|
| Out                | int8 |

### Implementation: FiP16

---

16 Bit Fixed Point Implementation

| Inports Data Type |       |
|-------------------|-------|
| In                | int16 |
| Init              | int16 |
| Enable            | bool  |

| Outports Data Type |       |
|--------------------|-------|
| Out                | int16 |

### Implementation: FiP32

---

32 Bit Fixed Point Implementation

| Inports Data Type |       |
|-------------------|-------|
| In                | int32 |
| Init              | int32 |
| Enable            | bool  |

| Outports Data Type |       |
|--------------------|-------|
| Out                | int32 |

### Implementation: Float32

---

32 Bit Floating Point Implementation

| Inports Data Type |         |
|-------------------|---------|
| In                | float32 |

## 4 Filter

Library with various kinds of digital filter blocks.

## Block: ACDC

---

Calculation of AC and DC part of input signal.

| Inports |              |
|---------|--------------|
| In      | Input signal |
| phi     | Angle signal |

| Outports |                         |
|----------|-------------------------|
| AC       | AC part of input signal |
| DC       | DC part of input signal |

| Mask Parameters |    |                                                                 |
|-----------------|----|-----------------------------------------------------------------|
| Name            | ID | Description                                                     |
| ts_fact         | 1  | Multiplication factor of base sampling time (in integer format) |

### Implementations:

|                |                                      |
|----------------|--------------------------------------|
| <b>FiP16</b>   | 16 Bit Fixed Point Implementation    |
| <b>FiP32</b>   | 32 Bit Fixed Point Implementation    |
| <b>Float32</b> | 32 Bit Floating Point Implementation |
| <b>Float64</b> | 64 Bit Floating Point Implementation |

### Implementation: FiP16

---

16 Bit Fixed Point Implementation

| Inports Data Type |       |
|-------------------|-------|
| In                | int16 |
| phi               | int16 |

| Outports Data Type |       |
|--------------------|-------|
| AC                 | int16 |
| DC                 | int16 |

### Implementation: FiP32

---

### 32 Bit Fixed Point Implementation

| Inports Data Type |       |
|-------------------|-------|
| In                | int32 |
| phi               | int32 |

| Outports Data Type |       |
|--------------------|-------|
| AC                 | int32 |
| DC                 | int32 |

### Implementation: Float32

---

#### 32 Bit Floating Point Implementation

| Inports Data Type |         |
|-------------------|---------|
| In                | float32 |
| phi               | float32 |

| Outports Data Type |         |
|--------------------|---------|
| AC                 | float32 |
| DC                 | float32 |

### Implementation: Float64

---

#### 64 Bit Floating Point Implementation

| Inports Data Type |         |
|-------------------|---------|
| In                | float64 |
| phi               | float64 |

| Outports Data Type |         |
|--------------------|---------|
| AC                 | float64 |
| DC                 | float64 |

| Name            | ID | Description                                                                    |
| Q               | 1  | Q-Factor of the notch filter                                                   |
| n_thresh        | 2  | Speed threshold for activating the filter                                      |
| n_max           | 3  | Maximum revolutions per minute<br>(Not used in floating point implementations) |
| p               | 4  | Number of pole pairs                                                           |
| ts_fact         | 5  | Multiplication factor of base sampling time (in integer format)                |
| method          | 6  | Discretization method                                                          |

### Description:

Calculation:

$$\text{Out}(k) = \begin{cases} \text{In}(k) & n(k) \leq n_{\text{thresh}} \\ \text{In}(k) \cdot H(z) & n(k) > n_{\text{thresh}} \end{cases}$$

The transfer function  $H(z)$  of the filter is

$$H(z) = \frac{b_0 + b_1 z^{-1} + b_2 z^{-2}}{1 + a_1 z^{-1} + a_2 z^{-2}}$$

with coefficients derived from the transfer function

$$H(s) = \frac{s^2 + \omega_0^2}{s^2 + \frac{\omega_0}{Q} + \omega_0^2}$$

by a matched Z-transformation.

## Block: BandpassBiQ

Calculates the filter coefficients for a second order bandpass and performs filtering on input signal.

Second order transfer function used:

$$H(z) = (b0.z^2 + b1.z + b2) / (z^2 + a1.z + a2)$$

| Inports |             |

| Name            | ID | Description                                                            |
| characteristic  | 1  | The filter characteristic is one of Butterworth (=Bessel) or Chebyshev |
| fc1             | 2  | Lower cut-off frequency in Hz                                          |
| fc2             | 3  | Upper cut-off frequency in Hz                                          |
| rc              | 4  | Attenuation at cut-off frequencies                                     |
| ts_fact         | 5  | Multiplication factor of base sampling time (in integer format)        |

### Description:

#### Butterworth

- center frequency  $f_c$ 
  - center frequency  $f_c$  is given by  $f_c^2 = f_{c1}^2 * f_{c2}^2$
  - zero phaseshift @center frequency  $f_c$
- @lower cut-off frequency  $f_{c1}$ 
  - -3dB attenuation
  - 45 degree phaseshift
- @upper cut-off frequency  $f_{c2}$ 
  - -3dB attenuation
  - -45 degree phaseshift
- stopband
  - monotonic -20dB decline per decade
  - roll-off dynamics are constant and not adjustable

E.g.:

The cut-off frequencies are  $f_{c1} = 10\text{Hz}$  and  $f_{c2} = 100\text{Hz}$ .

The bodeplot is shown in the figure 1 below.

Figure 1: Bodeplot Butterworth bandpass.

### Chebyshev

*Note:* A second order Chebyshev I bandpass has the same bodeplot as a second order Chebyshev II bandpass. Hence, only the 'Chebyshev' option is given.

- center frequency  $f_c$ 
  - center frequency  $f_c$  is given by  $f_c^2 = f_{c1}^2 * f_{c2}^2$
  - zero phaseshift @center frequency  $f_c$
- @lower cut-off frequency  $f_{c1}$ 
  - $-rc\text{dB}$  attenuation
  - phaseshift proportional to  $rc$
- @upper cut-off frequency  $f_{c2}$ 
  - $-rc\text{dB}$  attenuation
  - -phaseshift proportional to  $rc$
- stopband
  - monotonic  $-20\text{dB}$  decline per decade
  - roll-off dynamics are adjustable using parameter  $rc$

E.g.:

The cut-off frequencies are  $f_{c1} = 10\text{Hz}$  and  $f_{c2} = 100\text{Hz}$ .

The parameter  $rc$  is set to  $10\text{dB}$ .

The bodeplot is shown in the figure 2 below.

### Bessel

*Note:* A second order Bessel bandpass behaves exactly like a second order Butterworth bandpass. Hence, no 'Bessel' option is given.

### Implementations:

|                |                                      |

|-----|---------------|
| Out | Output Out(k) |
|-----|---------------|

### Mask Parameters

| Name           | ID | Description                                                            |
|----------------|----|------------------------------------------------------------------------|
| characteristic | 1  | The filter characteristic is one of Butterworth (=Bessel) or Chebyshev |
| fc1            | 2  | Lower cut-off frequency in Hz                                          |
| fc2            | 3  | Upper cut-off frequency in Hz                                          |
| rc             | 4  | Attenuation at cut-off frequencies                                     |
| ts_fact        | 5  | Multiplication factor of base sampling time (in integer format)        |

### Description:

#### Butterworth

- center frequency  $f_c$ 
  - center frequency  $f_c$  is given by  $f_c^2 = f_{c1}^2 * f_{c2}^2$
  - phase discontinuity @center frequency  $f_c$
- @lower cut-off frequency  $f_{c1}$ 
  - -3dB attenuation
  - -45 degree phaseshift
- @upper cut-off frequency  $f_{c2}$ 
  - -3dB attenuation
  - 45 degree phaseshift
- passband
  - roll-off dynamics are constant and not adjustable

Figure 3: Bodeplot Butterworth bandstop.

E.g.:

The cut-off frequencies are  $f_{c1} = 100\text{Hz}$  and  $f_{c2} = 300\text{Hz}$ .

The bodeplot is shown in the figure 3 below.

### Chebyshev

*Note:* A second order Chebyshev I bandstop has the same bodeplot as a second order Chebyshev II bandstop. Hence, only the 'Chebyshev' option is given.

- center frequency  $f_c$ 
  - center frequency  $f_c$  is given by  $f_c^2 = f_{c1}^2 * f_{c2}^2$
  - phase discontinuity @center frequency  $f_c$
- @lower cut-off frequency  $f_{c1}$ 
  - $-rc\text{dB}$  attenuation
  - -phaseshift proportional to  $rc$
- @upper cut-off frequency  $f_{c2}$ 
  - $-rc\text{dB}$  attenuation
  - phaseshift proportional to  $rc$
- passband
  - roll-off dynamics are adjustable using parameter  $rc$

E.g.:

The cut-off frequencies are  $f_{c1} = 100\text{Hz}$  and  $f_{c2} = 300\text{Hz}$ .

The parameter  $rc$  is set to 10dB.

The bodeplot is shown in the figure 4 below.

### Bessel

*Note:* A second order Bessel bandstop behaves exactly like a second order Butterworth bandstop. Hence, no 'Bessel' option is given.
