## Block: FundFreq

---

Calculation of the first harmonic (fundamental frequency) of the input signal.

| Inports |              |
|---------|--------------|
| In      | Input signal |
| phi     | Angle signal |

| Outports |                |
|----------|----------------|
| Out      | First harmonic |

| Mask Parameters |    |                                                                 |
|-----------------|----|-----------------------------------------------------------------|
| Name            | ID | Description                                                     |
| ts_fact         | 1  | Multiplication factor of base sampling time (in integer format) |

### Implementations:

- FiP16** 16 Bit Fixed Point Implementation
- FiP32** 32 Bit Fixed Point Implementation
- Float32** 32 Bit Floating Point Implementation
- Float64** 64 Bit Floating Point Implementation

### Implementation: FiP16

---

16 Bit Fixed Point Implementation

| Inports Data Type |       |
|-------------------|-------|
| In                | int16 |
| phi               | int16 |

| Outports Data Type |       |
|--------------------|-------|
| Out                | int16 |

### Implementation: FiP32

---

32 Bit Fixed Point Implementation

| Inports Data Type |       |
|-------------------|-------|
| In                | int32 |
| phi               | int32 |

| Outports Data Type |       |
|--------------------|-------|
| Out                | int32 |

### Implementation: Float32

32 Bit Floating Point Implementation

| Inports Data Type |         |
|-------------------|---------|
| In                | float32 |
| phi               | float32 |

| Outports Data Type |         |
|--------------------|---------|
| Out                | float32 |

### Implementation: Float64

64 Bit Floating Point Implementation

| Inports Data Type |         |
|-------------------|---------|
| In                | float64 |
| phi               | float64 |

| Outports Data Type |         |
|--------------------|---------|
| Out                | float64 |

## Block: HighpassBiQ

Calculates the filter coefficients for a second order highpass and performs filtering on input signal.

Second order transfer function used:

$$H(z) = (b0.z^2 + b1.z + b2) / (z^2 + a1.z + a2)$$

| Inports |             |

| rs              | 4  | The stopband ripple is only used and verified with 'Chebyshev II' filters.<br>Must be a positive number                |
| ts_fact         | 5  | Multiplication factor of base sampling time (in integer format)                                                        |

### Description:

#### Butterworth

- passband
  - maximal flat
- @cut-off frequency:
  - -3dB attenuation
  - -90 degree phaseshift
- stopband
  - monotonic -40dB decline per decade
  - approx. -37dB decline within first decade

E.g.: Cut-off frequency is 10Hz. The bodeplot is shown in the figure 5 below.

#### Chebyshev I

Figure 5: Bodeplot Butterworth highpass.

- passband:
  - $N/2=1$  ripple in the passband.
  - attenuation from 0 to  $rp$  [dB].
- @cut-off frequency: attenuation is bigger than or equal  $rp$  [dB].
- stopband:
  - monotonic -40dB decline per decade
- Trade-off:
  - the bigger passband ripple  $rp$  is chosen, the steeper is the magnitude cut-off within the first decade in stopband
  - the bigger the passband ripple  $rp$  is chosen, the bigger is the overall passband attenuation!

E.g.:

Cut-off frequency is 10Hz.

The maximal ripple in the passband  $rp$  must be given in [dB].

To show the mentioned trade-off, two bodeplots are shown. One with a small and one with a bigger  $rp$ . The bodeplot is shown in the figures 6 and 7 below.

Figure 6: Bodeplot Chebyshev I highpass.  $rp = 5\text{dB}$

## Chebyshev II

Also known as inverse Chebyshev filter.

- passband
  - flat, no ripples

Figure 7: Bodeplot Chebyshev I highpass.  $r_p = 20\text{dB}$

- @cut-off frequency: attenuation is  $r_s$  [dB].
- stopband
  - $N/2=1$  ripple in the stopband
  - attenuation is smaller than or equal  $r_s$  [dB].
- Trade-off:
  - the lower  $r_s$  is chosen, the sharper is the magnitude cut-off
  - the lower  $r_s$  is chosen, the lower is the over all stopband attenuation

E.g.:

Cut-off frequency is 10Hz.

The maximal ripple in the stopband  $r_s$  must be given in [dB].

To show the mentioned trade-off, two bodeplots are shown. One with a small and one with a bigger  $r_s$ . The bodeplot is shown in the figures 8 and 9 below.

Figure 8: Bodeplot Chebyshev II highpass.  $r_s = 5\text{dB}$

## Bessel

- passband
  - constant group-delay in passband.
  - least sharp magnitude roll-off.
- @cut-off frequency:
  - approx. -1.6 dB attenuation
  - approx. -56 degree phaseshift

Figure 9: Bodeplot Chebyshev II highpass.  $r_s = 20\text{dB}$

- stopband
  - monotonic -40dB decline per decade
  - approx. -30dB decline within first decade

E.g.:

Cut-off frequency is 10Hz.

The bodeplot is shown in the figure 10 below.

Figure 10: Bodeplot Bessel highpass.

### Implementations:

- FiP16** 16 Bit Fixed Point Implementation
- FiP32** 32 Bit Fixed Point Implementation
- Float32** 32 Bit Floating Point Implementation
- Float64** 64 Bit Floating Point Implementation

### Implementation: FiP16

16 Bit Fixed Point Implementation

| Inports Data Type  |       |
|--------------------|-------|
| In                 | int16 |
| Outports Data Type |       |
| Out                | int16 |

### Implementation: FiP32

---

32 Bit Fixed Point Implementation

| Inports Data Type |       |
|-------------------|-------|
| In                | int32 |

| Outports Data Type |       |

| Out                | float64 |

## Block: IIR

---

Transfer function:

$$H(z) = (b_0.z^n + b_1.z + \dots + b_n) / (a_0.z^n + a_1.z + \dots + a_n)$$

The maximum filter order is 32.

The order of the denominator has to be greater than or equal to the order of the numerator.

### Mask Parameters

| Name           | ID | Description                                                                                                            |
|----------------|----|------------------------------------------------------------------------------------------------------------------------|
| characteristic | 1  | The filter characteristic is one of Butterworth, Chebyshev I, Chebyshev II (also known as inverse Chebyshev) or Bessel |
| fc             | 2  | Cut-off frequency in Hz                                                                                                |
| rp             | 3  | The passband ripple is only used and verified with 'Chebyshev I' filters.<br>Must be a positive number                 |
| rs             | 4  | The stopband ripple is only used and verified with 'Chebyshev II' filters.<br>Must be a positive number                |
| ts_fact        | 5  | Multiplication factor of base sampling time (in integer format)                                                        |

### Description:

#### Butterworth

- passband
  - maximal flat
- @cut-off frequency:
  - -3dB attenuation
  - -90 degree phaseshift
- stopband
  - monotonic -40dB decline per decade
  - approx. -37dB decline within first decade

E.g.: Cut-off frequency is 10Hz. The bodeplot is shown in the figure 11 below.

#### Chebyshev I

Figure 11: Bodeplot Butterworth lowpass.

- passband:
  - $N/2=1$  ripple in the passband.
  - attenuation from 0 to  $r_p$  [dB].
- @cut-off frequency: attenuation is bigger than or equal  $r_p$  [dB].
- stopband:
  - monotonic -40dB decline per decade
- Trade-off:
  - the bigger passband ripple  $r_p$  is chosen, the steeper is the magnitude cut-off within the first decade in stopband
  - the bigger the passband ripple  $r_p$  is chosen, the bigger is the overall passband attenuation!

E.g.:

Cut-off frequency is 10Hz.

The maximal ripple in the passband  $r_p$  must be given in [dB].

To show the mentioned trade-off, two bodeplots are shown. One with a small and one with a bigger  $r_p$ . The bodeplot is shown in the figures 12 and 13 below.

Figure 12: Bodeplot Chebyshev I lowpass.  $r_p = 5\text{dB}$

## Chebyshev II

Also known as inverse Chebyshev filter.

- passband
  - flat, no ripples

Figure 13: Bodeplot Chebyshev I lowpass.  $r_p = 20\text{dB}$

- @cut-off frequency: attenuation is  $r_s$  [dB].
- stopband
  - $N/2=1$  ripple in the stopband
  - attenuation is smaller than or equal  $r_s$  [dB].
- Trade-off:
  - the lower  $r_s$  is chosen, the sharper is the magnitude cut-off
  - the lower  $r_s$  is chosen, the lower is the over all stopband attenuation

E.g.:

Cut-off frequency is 10Hz.

The maximal ripple in the stopband  $r_s$  must be given in [dB].

To show the mentioned trade-off, two bodeplots are shown. One with a small and one with a bigger  $r_s$ . The bodeplot is shown in the figures 14 and 15 below.

Figure 14: Bodeplot Chebyshev II lowpass.  $r_s = 20\text{dB}$

## Bessel

- passband
  - constant group-delay in passband.
  - least sharp magnitude roll-off.
- @cut-off frequency:
  - approx. -1.6 dB attenuation
  - approx. -56 degree phaseshift

Figure 15: Bodeplot Chebyshev II lowpass.  $r_s = 5\text{dB}$

- stopband
  - monotonic -40dB decline per decade
  - approx. -30dB decline within first decade

E.g.:

Cut-off frequency is 10Hz.

The bodeplot is shown in the figure 16 below.

Figure 16: Bodeplot Bessel lowpass.

## Block: NotchBiQ

Calculates the filter coefficients for a second order notch filter and performs filtering on input signal.

Second order transfer function used:

$$H(z) = (b_0 \cdot z^2 + b_1 \cdot z + b_2) / (z^2 + a_1 \cdot z + a_2)$$

| Inports |             |

### Description:

Calculation:

$$\text{Out}(k) = \text{In}(k) \cdot H(z)$$

The transfer function  $H(z)$  of the filter is

$$H(z) = \frac{b_0 + b_1 z^{-1} + b_2 z^{-2}}{1 + a_1 z^{-1} + a_2 z^{-2}}$$

with coefficients derived from the transfer function

$$H(s) = \frac{s^2 + \omega_0^2}{s^2 + \frac{\omega_0}{Q} s + \omega_0^2}$$

Two methods of discretizing a continuous transfer function are available: bilinear and matching.

Warning: In some cases, the function is very sensitive to the accuracy of the coefficients. Therefore, using a fixed-point implementation can sometimes give inaccurate results.

To illustrate this issue, see step responses in figures 17 and 18 below. Filter settings are  $f_n = 50$  Hz,  $Q = 10$ ,  $f_s = 10$  kHz.

Figure 17: Step response for  $ts\_fact = 1$ .

Figure 18: Step response for  $t\_fact = 10$ .

### Implementations:

- FiP16**      16 Bit Fixed Point Implementation
- FiP32**      32 Bit Fixed Point Implementation
- Float32**    32 Bit Floating Point Implementation
- Float64**    64 Bit Floating Point Implementation

### Implementation: FiP16

16 Bit Fixed Point Implementation

| Inports Data Type  |       |
|--------------------|-------|
| In                 | int16 |
| Outports Data Type |       |
| Out                | int16 |

### Implementation: FiP32

---

32 Bit Fixed Point Implementation

| Inports Data Type |       |
|-------------------|-------|
| In                | int32 |

| Outports Data Type |       |
|--------------------|-------|
| Out                | int32 |

### Implementation: Float32

---

32 Bit Floating Point Implementation

| Inports Data Type |         |
|-------------------|---------|
| In                | float32 |

| Outports Data Type |         |
|--------------------|---------|
| Out                | float32 |

### Implementation: Float64

---

64 Bit Floating Point Implementation

| Inports Data Type |         |
|-------------------|---------|
| In                | float64 |

| Outports Data Type |         |
|--------------------|---------|
| Out                | float64 |

## Block: AutoSwitch

---

Switch between In1 and In3 dependent on Switch signal:

Switch signal rising: Switch  $\geq$  Threshold up  $\rightarrow$  Out = In1

Switch signal falling: Switch  $<$  Threshold down  $\rightarrow$  Out = In3

| Inports |                            |
|---------|----------------------------|
| In1     | Input #1                   |
| Switch  | Input #2: Threshold signal |
| In3     | Input #3                   |

| Outputs |                                                                     |
|---------|---------------------------------------------------------------------|
| Out     | Either value of input #1 or input #3 dependent on value of input #2 |

| Mask Parameters |    |                                           |
|-----------------|----|-------------------------------------------|
| Name            | ID | Description                               |
| Thresh_up       | 1  | Threshold level for rising switch signal  |
| Thresh_down     | 2  | Threshold level for falling switch signal |

### Implementations:

8 Bit Integer Implementation

| Outputs Data Type |      |
|-------------------|------|
| Out               | int8 |

### Implementation: Int16

---

16 Bit Integer Implementation

| Outports Data Type |       |
|--------------------|-------|
| Out                | int16 |

### Implementation: Int32

32 Bit Integer Implementation

| Outports Data Type |       |
|--------------------|-------|
| Out                | int32 |

### Implementation: FiP8

8 Bit Fixed Point Implementation

| Outports Data Type |      |
|--------------------|------|
| Out                | int8 |

### Implementation: FiP16

16 Bit Fixed Point Implementation

| Outports Data Type |       |
|--------------------|-------|
| Out                | int16 |

### Implementation: FiP32

32 Bit Fixed Point Implementation

| Outports Data Type |       |
|--------------------|-------|
| Out                | int32 |

### Implementation: Float32

32 Bit Floating Point Implementation

| Outports Data Type |         |
|--------------------|---------|
| Out                | float32 |

## Implementation: Float64

---

64 Bit Floating Point Implementation

| Outports Data Type |         |
|--------------------|---------|
| Out                | float64 |

**Verification: Constant Bool CPU TMS320F28335**

## Block: Inport

| Inports |                           |
|---------|---------------------------|
| IN      | Signal from frame program |

| Mask Parameters |                                                                 |
|-----------------|-----------------------------------------------------------------|
| ts_fact         | Multiplication factor of base sampling time (in integer format) |
| Gain            | Gain value used in simulation                                   |
| Offset          | Offset value used in simulation                                 |

### Description:

Serves as interface to the frame program. The input of this block is intended for simulation purposes and can be left unconnected if not used. Also the parameters *Gain* and *Offset* are only used during simulation. The schematic for simulation can be seen in the figure below.

**Note:** Currently, *Gain* and *Offset* parameters are only available in Matlab/Simulink.

### Data Types:

|                |                       |
|----------------|-----------------------|
| <b>bool</b>    | Boolean               |
| <b>int8</b>    | 8 Bit Fixed Point     |
| <b>int16</b>   | 16 Bit Fixed Point    |
| <b>int32</b>   | 32 Bit Fixed Point    |
| <b>float32</b> | 32 Bit Floating Point |
| <b>float64</b> | 64 Bit Floating Point |

## Block: Int2Real

---

Conversion block from integer (fixed point) datatypes to real (floating point) datatypes.

$\text{Out} = \text{In} * \text{Scale}$

| Inports |               |
|---------|---------------|
| In      | Integer input |

| Outports |             |
|----------|-------------|
| Out      | Real output |

| Mask Parameters |    |                                     |
|-----------------|----|-------------------------------------|
| Name            | ID | Description                         |
| Scale           | 1  | Scaling factor from integer to real |

### Implementations:

|                      |                                                            |
|----------------------|------------------------------------------------------------|
| <b>FiP8_Float32</b>  | 8 Bit Fixed Point to 32 Bit Floating Point Implementation  |
| <b>FiP16_Float32</b> | 16 Bit Fixed Point to 32 Bit Floating Point Implementation |
| <b>FiP32_Float32</b> | 32 Bit Fixed Point to 32 Bit Floating Point Implementation |
| <b>FiP8_Float64</b>  | 8 Bit Fixed Point to 64 Bit Floating Point Implementation  |
| <b>FiP16_Float64</b> | 16 Bit Fixed Point to 64 Bit Floating Point Implementation |
| <b>FiP32_Float64</b> | 32 Bit Fixed Point to 64 Bit Floating Point Implementation |
| <b>Bool_Float32</b>  | Boolean to 32 Bit Floating Point Implementation            |

| Avg CPU cycles  | 637 |

## Block: Limitation

---

Limits the input signal to min and max\_sci.

Caution: For correct computation the upper limit max has to be greater than the lower limit min!

| Inports |              |
|---------|--------------|
| In      | Input signal |
| max     | Upper limit  |
| min     | Lower limit  |

| Outports |                      |
|----------|----------------------|
| Out      | Limited input signal |

### Description:

Calculation:

$$\text{Out} = \begin{cases} \text{max} & \text{In} > \text{max} \\ \text{In} & \\ \text{min} & \text{In} < \text{min} \end{cases}$$

### Implementations:

- FiP16** 16 Bit Fixed Point Implementation
- FiP32** 32 Bit Fixed Point Implementation
- Float32** 32 Bit Floating Point Implementation
- Float64** 64 Bit Floating Point Implementation

### Implementation: FiP16

---

16 Bit Fixed Point Implementation

| Inports Data Type |       |
|-------------------|-------|
| In                | int16 |
| max               | int16 |
| min               | int16 |

| Outports Data Type |       |
|--------------------|-------|
| Out                | int16 |

### Implementation: FiP32

32 Bit Fixed Point Implementation

| Inports Data Type |       |
|-------------------|-------|
| In                | int32 |
| max               | int32 |
| min               | int32 |

| Outports Data Type |       |
|--------------------|-------|
| Out                | int32 |

### Implementation: Float32

32 Bit Floating Point Implementation

| Inports Data Type |         |
|-------------------|---------|
| In                | float32 |
| max               | float32 |
| min               | float32 |

| Outports Data Type |         |
|--------------------|---------|
| Out                | float32 |

### Implementation: Float64

64 Bit Floating Point Implementation

| Inports Data Type |         |
|-------------------|---------|
| In                | float64 |
| max               | float64 |
| min               | float64 |

| Outports Data Type |         |
|--------------------|---------|
| Out                | float64 |

## Block: LookupTable

---

Look-up Table with 256+1 values.

Note: 257th value is used for preventing index overflow during interpolation.

-> for periodic signals the 257th value should be set equal to 1st value

-> for non-periodic signals the 257th value should be set equal to 256th value

| Inports |             |
|---------|-------------|
| In      | Table index |

| Outputs |              |
|---------|--------------|
| Out     | Table output |

| Mask Parameters |    |               |
|-----------------|----|---------------|
| Name            | ID | Description   |
| Lookup          | 1  | Look-up Table |

### Implementations:

- FiP8**      8 Bit Fixed Point Implementation
- FiP16**    16 Bit Fixed Point Implementation
- FiP32**    32 Bit Fixed Point Implementation

### Implementation: FiP8

---

8 Bit Fixed Point Implementation

| Inports Data Type |      |
|-------------------|------|
| In                | int8 |

| Outputs Data Type |      |
|-------------------|------|
| Out               | int8 |

### Implementation: FiP16

---

16 Bit Fixed Point Implementation

| Inports Data Type |       |
|-------------------|-------|
| In                | int16 |

| Outports Data Type |       |
|--------------------|-------|
| Out                | int16 |

### Implementation: FiP32

32 Bit Fixed Point Implementation

| Inports Data Type |       |
|-------------------|-------|
| In                | int32 |

| Outports Data Type |       |
|--------------------|-------|
| Out                | int32 |

# Block: LookupTable1D

One dimensional look-up table with selectable number of data points.  
Table data must be an array of size DimX. If one of the RAM implementations is used, DimX must not exceed 257.  
If input is out of specified range, output will be cut off (no extrapolation).

| Inports |                            |
|---------|----------------------------|
| x       | Table index in x direction |

| Outports |              |
|----------|--------------|
| Out      | Table output |

| Mask Parameters |    |                                                      |
|-----------------|----|------------------------------------------------------|
| Name            | ID | Description                                          |
| TableData       | 1  | Look-up table data                                   |
| DimX            | 2  | Number of data points in x-direction                 |
| x_min           | 3  | Minimum input value of x-dimension for look-up table |
| x_max           | 4  | Maximum input value of x-dimension for look-up table |

## Description:

The table of the LookupTable1D block must contain DimX data points and they have to be arranged as

$$\text{TableData} = [f(x_1), f(x_2), \dots f(x_{n-1}), f(x_n)]$$

with n as the selected DimX value.  
For periodic signals, the last entry must be identical to the first entry, see the example in the following figure.

For non-periodic signals there is no restriction regarding the last data point, see the example in the figure below.

### Implementations:

|                    |                                                                                 |
|--------------------|---------------------------------------------------------------------------------|
| <b>FiP16</b>       | 64 Bit Floating Point Implementation with look-up table located in RAM          |

## Block: LookupTable2D

Two dimensional look-up table with selectable number of data points.

Table data must be an array of size DimX\*DimY.

If input is out of specified range, output will be cut off (no extrapolation).

| Inports |                            |
|---------|----------------------------|
| x       | Table index in x direction |
| y       | Table index in y direction |

| Outputs |              |
|---------|--------------|
| Out     | Table output |

| Mask Parameters |    |                                                      |
|-----------------|----|------------------------------------------------------|
| Name            | ID | Description                                          |
| TableData       | 1  | Look-up table data                                   |
| DimX            | 2  | Number of data points in x-direction                 |
| x_min           | 3  | Minimum input value of x-dimension for look-up table |
| x_max           | 4  | Maximum input value of x-dimension for look-up table |
| DimY            | 5  | Number of data points in y-direction                 |
| y_min           | 6  | Minimum input value of y-dimension for look-up table |
| y_max           | 7  | Maximum input value of y-dimension for look-up table |

### Description:

The table of the LookupTable2D block must contain DimX times DimY data points and they have to be arranged as

$$\begin{aligned}
 \text{TableData} = & [f(x_1, y_1), f(x_2, y_1), \dots, f(x_{n-1}, y_1), f(x_n, y_1), \\
 & f(x_1, y_2), f(x_2, y_2), \dots, f(x_{n-1}, y_2), f(x_n, y_2), \\
 & \dots \\
 & f(x_1, y_{m-1}), f(x_2, y_{m-1}), \dots, f(x_{n-1}, y_{m-1}), f(x_n, y_{m-1}), \\
 & f(x_1, y_m), f(x_2, y_m), \dots, f(x_{n-1}, y_m), f(x_n, y_m)]
 \end{aligned}$$

with n as selected DimX and m as selected DimY values.

For periodic signals, the last entries per dimension must be identical to the first entries in this dimension, see the example in the following figure.

For non-periodic signals there is no restriction regarding the last data points, see the example in the figure below.

#### Implementations:

- FiP16** 16 Bit Fixed Point Implementation
- FiP32** 32 Bit Fixed Point Implementation
- Float32** 32 Bit Floating Point Implementation
- Float64** 64 Bit Floating Point Implementation

#### Implementation: FiP16

---

## 16 Bit Fixed Point Implementation

| Inports Data Type |       |
|-------------------|-------|
| x                 | int16 |
| y                 | int16 |

| Outports Data Type |       |
|--------------------|-------|
| Out                | int16 |

## Implementation: FiP32

### 32 Bit Fixed Point Implementation

| Inports Data Type |       |
|-------------------|-------|
| x                 | int32 |
| y                 | int32 |

| Outports Data Type |       |
|--------------------|-------|
| Out                | int32 |

## Implementation: Float32

### 32 Bit Floating Point Implementation

| Inports Data Type |         |
|-------------------|---------|
| x                 | float32 |
| y                 | float32 |

| Outports Data Type |         |
|--------------------|---------|
| Out                | float32 |

## Implementation: Float64

### 64 Bit Floating Point Implementation

| Inports Data Type |         |
|-------------------|---------|
| x                 | float64 |
| y                 | float64 |

| Outports Data Type |         |
|--------------------|---------|
| Out                | float64 |

## Block: LookupTable3D

Three dimensional look-up table with selectable number of data points.

Table data must be an array of size DimX\*DimY\*DimZ.

If input is out of specified range, output will be cut off (no extrapolation).

| Inports |                            |
|---------|----------------------------|
| x       | Table index in x direction |
| y       | Table index in y direction |
| z       | Table index in z direction |

| Outputs |              |
|---------|--------------|
| Out     | Table output |

| Mask Parameters |    |                                                      |
|-----------------|----|------------------------------------------------------|
| Name            | ID | Description                                          |
| TableData       | 1  | Look-up table data                                   |
| DimX            | 2  | Number of data points in x-direction                 |
| x_min           | 3  | Minimum input value of x-dimension for look-up table |
| x_max           | 4  | Maximum input value of x-dimension for look-up table |
| DimY            | 5  | Number of data points in y-direction                 |
| y_max           | 6  | Maximum input value of y-dimension for look-up table |
| y_min           | 7  | Minimum input value of y-dimension for look-up table |
| DimZ            | 8  | Number of data points in z-direction                 |
| z_min           | 9  | Minimum input value of z-dimension for look-up table |
| z_max           | 10 | Maximum input value of z-dimension for look-up table |

### Description:

The table of the LookupTable3D block must contain DimX times DimY times DimZ data points and they have to be arranged as

$$\begin{aligned} \text{TableData} = & [f(x_1, y_1, z_1), f(x_2, y_1, z_1), \dots, f(x_{n-1}, y_1, z_1), f(x_n, y_1, z_1), \\ & f(x_1, y_2, z_1), f(x_2, y_2, z_1), \dots, f(x_{n-1}, y_2, z_1), f(x_n, y_2, z_1), \\ & \dots \\ & f(x_1, y_{m-1}, z_1), f(x_2, y_{m-1}, z_1), \dots, f(x_{n-1}, y_{m-1}, z_1), f(x_n, y_{m-1}, z_1), \\ & f(x_1, y_m, z_1), f(x_2, y_m, z_1), \dots, f(x_{n-1}, y_m, z_1), f(x_n, y_m, z_1) \\ & f(x_1, y_1, z_2), f(x_2, y_1, z_2), \dots, f(x_{n-1}, y_1, z_2), f(x_n, y_1, z_2), \\ & f(x_1, y_2, z_2), f(x_2, y_2, z_2), \dots, f(x_{n-1}, y_2, z_2), f(x_n, y_2, z_2), \\ & \dots \\ & f(x_1, y_{m-1}, z_k), f(x_2, y_{m-1}, z_k), \dots, f(x_{n-1}, y_{m-1}, z_k), f(x_n, y_{m-1}, z_k), \\ & f(x_1, y_m, z_k), f(x_2, y_m, z_k), \dots, f(x_{n-1}, y_m, z_k), f(x_n, y_m, z_k)] \end{aligned}$$

with n as selected DimX, m as selected DimY and k as selected DimZ values.

For interpolation of the data, the trilinear interpolation method is used. The interpolation is implemented as

$$f(x, y, z) = c_0 + c_1\Delta x + c_2\Delta y + c_3\Delta z + c_4\Delta x\Delta y + c_5\Delta y\Delta z + c_6\Delta z\Delta x + c_7\Delta x\Delta y\Delta z$$

with  $\Delta x$ ,  $\Delta y$ ,  $\Delta z$  as relative distances to the starting point  $f_{000}$  and with the coefficients

$$\begin{aligned} c_0 &= f_{000} \\ c_1 &= f_{100} - f_{000} \\ c_2 &= f_{010} - f_{000} \\ c_3 &= f_{001} - f_{000} \\ c_4 &= f_{110} - f_{010} - f_{100} + f_{000} \\ c_5 &= f_{011} - f_{001} - f_{010} + f_{000} \\ c_6 &= f_{101} - f_{001} - f_{100} + f_{000} \\ c_7 &= f_{111} - f_{011} - f_{101} - f_{110} + f_{100} + f_{001} + f_{010} - f_{000} \end{aligned}$$

derived from the lattice points relative to the starting point.

## Block: ManualSwitch

---

Toggling between inputs by double-clicking on block.

| Inports |          |
|---------|----------|
| In1     | Input #1 |
| In2     | Input #2 |

| Outputs |  |
|---------|--|
| Out     |  |

| Mask Parameters |    |             |
|-----------------|----|-------------|
| Name            | ID | Description |
| Toggle          | 1  | Toggle      |

### Description:

Doubleclicking of the *ManualSwitch* block changes the routing of the input signals and doesn't open the *Function Block Parameters* dialog. So if changing the implementation is required, one has to open the dialog via *Mask Parameters* command of the context menu.

**Developer note:** To get the double-click feature the callback function of *OpenFnc* in *Block Properties* is manually altered to

```
if get_param(gcb, 'Toggle') == '0'
    set_param(gcb, 'Toggle', '1');
else
    set_param(gcb, 'Toggle', '0');
end
setBlockData(gcs, gcb);
initSFunction(gcb);
```

### Implementations:

## Block: Minimum

---

Outputs the lesser value of the two input signals.

| Inports |          |
|---------|----------|
| In1     | Input #1 |
| In2     | Input #2 |

| Outports |                                  |
|----------|----------------------------------|
| Out      | Minimum of Input #1 and Input #2 |

### Description:

Calculation:

$$\text{Out} = \min(\text{In}_1, \text{In}_2)$$

### Implementations:

|                |                                      |
|----------------|--------------------------------------|
| <b>FiP16</b>   | 16 Bit Fixed Point Implementation    |
| <b>FiP32</b>   | 32 Bit Fixed Point Implementation    |
| <b>Float32</b> | 32 Bit Floating Point Implementation |
| <b>Float64</b> | 64 Bit Floating Point Implementation |

### Implementation: FiP16

---

16 Bit Fixed Point Implementation

| Inports Data Type |       |
|-------------------|-------|
| In1               | int16 |
| In2               | int16 |

| Outports Data Type |       |
|--------------------|-------|
| Out                | int16 |

### Implementation: FiP32

---

32 Bit Fixed Point Implementation

| Inports Data Type |       |
|-------------------|-------|
| In1               | int32 |
| In2               | int32 |

| Outports Data Type |       |
|--------------------|-------|
| Out                | int32 |

### Implementation: Float32

32 Bit Floating Point Implementation

| Inports Data Type |         |
|-------------------|---------|
| In1               | float32 |
| In2               | float32 |

| Outports Data Type |         |
|--------------------|---------|
| Out                | float32 |

### Implementation: Float64

64 Bit Floating Point Implementation

| Inports Data Type |         |
|-------------------|---------|
| In1               | float64 |
| In2               | float64 |

| Outports Data Type |         |
|--------------------|---------|
| Out                | float64 |

**Verification: Minimum FiP16 CPU TMS320F28335**

## Block: Output

### Outputs

|     |                         |
|-----|-------------------------|
| OUT | Signal to frame program |
|-----|-------------------------|

### Mask Parameters

|         |                                                                 |
|---------|-----------------------------------------------------------------|
| ts_fact | Multiplication factor of base sampling time (in integer format) |
| Gain    | Gain value used in simulation                                   |
| Offset  | Offset value used in simulation                                 |

### Description:

Serves as interface to the frame program. The output of this block is intended for simulation purposes and can be left unconnected if not used. Also the parameters *Gain*, and *Offset* are only used during simulation. The schematic for simulation can be seen in the figure below. The Unit Delay block is only used during simulation and should reflect the time delay caused by a discrete controller.

**Note:** Currently, *Gain* and *Offset* parameters are only available in Matlab/Simulink.

### Data Types:

|                |                       |
|----------------|-----------------------|
| <b>bool</b>    | Boolean               |
| <b>int8</b>    | 8 Bit Fixed Point     |
| <b>int16</b>   | 16 Bit Fixed Point    |
| <b>int32</b>   | 32 Bit Fixed Point    |
| <b>float32</b> | 32 Bit Floating Point |
| <b>float64</b> | 64 Bit Floating Point |

## Block: RateLimiter

---

Limitation of rising and falling rate.

Function of Enable:

0: rate limiting disabled, signal is passed through

1: rate limiting enabled, signal is rate limited

0->1: preload of output with value from init input

| Inports |                                                                                                                                                                                         |
|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| In      |                                                                                                                                                                                         |
| Init    | Value which is loaded at rising flanke of enable signal                                                                                                                                 |
| Enable  | Enable == 0: Deactivation of block; Out is set to In.<br>Enable != 0: Activation of block; Out is rate limited.<br>Enable 0->1: Preloading of output; Out is set to value of Init input |

| Outports |  |
|----------|--|
| Out      |  |

| Mask Parameters |    |                                                                 |
|-----------------|----|-----------------------------------------------------------------|
| Name            | ID | Description                                                     |
| Tr              | 1  | Rising time in seconds. Slew rate will be $1/Tr$                |
| Tf              | 2  | Falling time in seconds. Slew rate will be $1/Tf$               |
| ts_fact         | 3  | Multiplication factor of base sampling time (in integer format) |

### Description:

Rising and falling time refer to a step from 0 to 1. Entries for *Tr*: *Rising time* and *Tf*: *Falling time* smaller than the actual sample time will be limited to the sample time internally.

The 16- and 32-Bit fixed point implementations are based on an internal 32-Bit wide slew-rate variable while the 8-Bit fixed point implementation uses a 16-Bit wide slew-rate variable.

### Implementations:

|                |                                      |
|----------------|--------------------------------------|

## Block: Real2Int

---

Conversion block from real (floating point) datatypes to integer (fixed point) datatypes.

$\text{Out} = \text{In} / \text{Scale}$

| Inports |            |
|---------|------------|
| In      | Real input |

| Outports |                |
|----------|----------------|
| Out      | Integer output |

| Mask Parameters |    |                                     |
|-----------------|----|-------------------------------------|
| Name            | ID | Description                         |
| Scale           | 1  | Scaling factor from real to integer |

### Implementations:

|                      |                                                        |
|----------------------|--------------------------------------------------------|
| <b>Float32_FiP8</b>  | 32 Floating Point to 8 Bit Fixed Point Implementation  |
| <b>Float32_FiP16</b> | 32 Floating Point to 16 Bit Fixed Point Implementation |
| <b>Float32_FiP32</b> | 32 Floating Point to 32 Bit Fixed Point Implementation |
| <b>Float64_FiP8</b>  | 64 Floating Point to 8 Bit Fixed Point Implementation  |
| <b>Float64_FiP16</b> | 64 Floating Point to 16 Bit Fixed Point Implementation |
| <b>Float64_FiP32</b> | 64 Floating Point to 32 Bit Fixed Point Implementation |
| <b>Float32_Bool</b>  | 32 Floating Point to Boolean Implementation            |
| <b>Float64_Bool</b>  | 64 Floating Point to Boolean Implementation            |

### Implementation: Float32\_FiP8

---

32 Floating Point to 8 Bit Fixed Point Implementation

| Inports Data Type |         |
|-------------------|---------|
| In                | float32 |

| Outports Data Type |      |
|--------------------|------|
| Out                | int8 |

### Implementation: Float32\_FiP16

---

32 Floating Point to 16 Bit Fixed Point Implementation

| Inports Data Type |         |
|-------------------|---------|
| In                | float32 |

| Outports Data Type |       |
|--------------------|-------|
| Out                | int16 |

### Implementation: Float32\_FiP32

32 Floating Point to 32 Bit Fixed Point Implementation

| Inports Data Type |         |
|-------------------|---------|
| In                | float32 |

| Outports Data Type |       |
|--------------------|-------|
| Out                | int32 |

### Implementation: Float64\_FiP8

64 Floating Point to 8 Bit Fixed Point Implementation

| Inports Data Type |         |
|-------------------|---------|
| In                | float64 |

| Outports Data Type |      |
|--------------------|------|
| Out                | int8 |

### Implementation: Float64\_FiP16

64 Floating Point to 16 Bit Fixed Point Implementation

| Inports Data Type |         |
|-------------------|---------|
| In                | float64 |

| Outports Data Type |       |
|--------------------|-------|
| Out                | int16 |

### Implementation: Float64\_FiP32

64 Floating Point to 32 Bit Fixed Point Implementation

| Inports Data Type |         |
|-------------------|---------|
| In                | float64 |

| Outports Data Type |       |
|--------------------|-------|
| Out                | int32 |

### Implementation: Float32\_Bool

32 Floating Point to Boolean Implementation

| Inports Data Type |         |
|-------------------|---------|
| In                | float32 |

| Outports Data Type |      |
|--------------------|------|
| Out                | bool |

### Implementation: Float64\_Bool

64 Floating Point to Boolean Implementation

| Inports Data Type |         |
|-------------------|---------|
| In                | float64 |

| Outports Data Type |      |
|--------------------|------|
| Out                | bool |

## Block: Saturation

---

Saturation of output to adjustable upper and lower limit.

| Inports |       |
|---------|-------|
| In      | Input |

| Outports |                |
|----------|----------------|
| Out      | Limited output |

| Mask Parameters |    |             |
|-----------------|----|-------------|
| Name            | ID | Description |
| max             | 1  | Upper Limit |
| min             | 2  | Lower Limit |

### Description:

If the entry for *Upper Limit* is lower than the entry for *Lower Limit* then the limits will be swapped internally.

### Implementations:

|                |                                      |
|----------------|--------------------------------------|
| <b>FiP16</b>   | 16 Bit Fixed Point Implementation    |
| <b>FiP32</b>   | 32 Bit Fixed Point Implementation    |
| <b>Float32</b> | 32 Bit Floating Point Implementation |
| <b>Float64</b> | 64 Bit Floating Point Implementation |

### Implementation: FiP16

---

16 Bit Fixed Point Implementation

| Inports Data Type |       |
|-------------------|-------|
| In                | int16 |

| Outports Data Type |       |
|--------------------|-------|
| Out                | int16 |

### Implementation: FiP32

---

32 Bit Fixed Point Implementation

| Inports Data Type |       |
|-------------------|-------|
| In                | int32 |

| Outports Data Type |       |
|--------------------|-------|
| Out                | int32 |

### Implementation: Float32

32 Bit Floating Point Implementation

| Inports Data Type |         |
|-------------------|---------|
| In                | float32 |

| Outports Data Type |         |
|--------------------|---------|
| Out                | float32 |

### Implementation: Float64

64 Bit Floating Point Implementation

| Inports Data Type |         |
|-------------------|---------|
| In                | float64 |

| Outports Data Type |         |
|--------------------|---------|
| Out                | float64 |

## Block: SaveSignal

---

Makes the incoming signal accessible for reading with parameter numbers.

| Inports |                          |
|---------|--------------------------|
| In      | Input signal to be saved |

### Implementations:

|                |                                      |
|----------------|--------------------------------------|
| <b>Bool</b>    | Boolean Implementation               |
| <b>FiP8</b>    | 8 Bit Fixed Point Implementation     |
| <b>FiP16</b>   | 16 Bit Fixed Point Implementation    |
| <b>FiP32</b>   | 32 Bit Fixed Point Implementation    |
| <b>Float32</b> | 32 Bit Floating Point Implementation |
| <b>Float64</b> | 64 Bit Floating Point Implementation |

### Implementation: Bool

---

Boolean Implementation

| Inports Data Type |      |
|-------------------|------|
| In                | bool |

### Implementation: FiP8

---

8 Bit Fixed Point Implementation

| Inports Data Type |      |
|-------------------|------|
| In                | int8 |

### Implementation: FiP16

---

16 Bit Fixed Point Implementation

| Inports Data Type |       |
|-------------------|-------|
| In                | int16 |

### Implementation: FiP32

---

32 Bit Fixed Point Implementation

| Inports Data Type |       |
|-------------------|-------|
| In                | int32 |

### Implementation: Float32

---

32 Bit Floating Point Implementation

| Inports Data Type |         |
|-------------------|---------|
| In                | float32 |

### Implementation: Float64

---

64 Bit Floating Point Implementation

| Inports Data Type |         |
|-------------------|---------|
| In                | float64 |

## Block: Selector

---

Passing through of input signal selected by the select inport:

Select = 0 (DSP): Out = In0

Select = 1 (DSP): Out = In1

...

Select = 7 (DSP): Out = In7

| Inports |              |
|---------|--------------|
| In0     | Input #0     |
| In1     | Input #1     |
| In2     | Input #2     |
| In3     | Input #3     |
| In4     | Input #4     |
| In5     | Input #5     |
| In6     | Input #6     |
| In7     | Input #7     |
| Select  | Input select |

| Outports |                       |
|----------|-----------------------|
| Out      | Selected input signal |

### Implementations:

|                |                                      |
|----------------|--------------------------------------|
| <b>FiP8</b>    | 8 Bit Fixed Point Implementation     |
| <b>FiP16</b>   | 16 Bit Fixed Point Implementation    |
| <b>FiP32</b>   | 32 Bit Fixed Point Implementation    |
| <b>Float32</b> | 32 Bit Floating Point Implementation |
| <b>Float64</b> | 64 Bit Floating Point Implementation |

### Implementation: FiP8

---

8 Bit Fixed Point Implementation

| Inports Data Type |      |

## Block: Sequencer

Generation of time delayed (enable) sequence.

| Inports |                                              |
|---------|----------------------------------------------|
| Start   | Start signal. Rising flank triggers sequence |

| Outports |           |
|----------|-----------|
| Out1     | Output #1 |
| Out2     | Output #2 |
| Out3     | Output #3 |
| Out4     | Output #4 |

| Mask Parameters |    |                                                                 |
|-----------------|----|-----------------------------------------------------------------|
| Name            | ID | Description                                                     |
| Delay1          | 1  | Time delay for output 1                                         |
| Delay2          | 2  | Time delay for output 2                                         |
| Delay3          | 3  | Time delay for output 3                                         |
| Delay4          | 4  | Time delay for output 4                                         |
| ts_fact         | 5  | Multiplication factor of base sampling time (in integer format) |

### Implementations:

|                |                                      |
|----------------|--------------------------------------|
| <b>Bool</b>    | Boolean Implementation               |
| <b>FiP8</b>    | 8 Bit Fixed Point Implementation     |
| <b>FiP16</b>   | 16 Bit Fixed Point Implementation    |
| <b>FiP32</b>   | 32 Bit Fixed Point Implementation    |
| <b>Float32</b> | 32 Bit Floating Point Implementation |
| <b>Float64</b> | 64 Bit Floating Point Implementation |

### Implementation: Bool

Boolean Implementation

| Inports Data Type |      |
|-------------------|------|
| Start             | bool |

| Outports Data Type |      |
|--------------------|------|
| Out1               | bool |
| Out2               | bool |
| Out3               | bool |
| Out4               | bool |

### Implementation: FiP8

8 Bit Fixed Point Implementation

| Inports Data Type |      |
|-------------------|------|
| Start             | int8 |

| Outports Data Type |      |
|--------------------|------|
| Out1               | int8 |
| Out2               | int8 |
| Out3               | int8 |
| Out4               | int8 |

### Implementation: FiP16

16 Bit Fixed Point Implementation

| Inports Data Type |       |
|-------------------|-------|
| Start             | int16 |

| Outports Data Type |       |
|--------------------|-------|
| Out1               | int16 |
| Out2               | int16 |
| Out3               | int16 |
| Out4               | int16 |

### Implementation: FiP32

32 Bit Fixed Point Implementation

| Inports Data Type |       |
|-------------------|-------|
| Start             | int32 |

| Outports Data Type |       |
|--------------------|-------|
| Out1               | int32 |
| Out2               | int32 |
| Out3               | int32 |
| Out4               | int32 |

### Implementation: Float32

32 Bit Floating Point Implementation

| Inports Data Type |         |
|-------------------|---------|
| Start             | float32 |

| Outports Data Type |         |
|--------------------|---------|
| Out1               | float32 |
| Out2               | float32 |
| Out3               | float32 |
| Out4               | float32 |

### Implementation: Float64

64 Bit Floating Point Implementation

| Inports Data Type |         |
|-------------------|---------|
| Start             | float64 |

| Outports Data Type |         |
|--------------------|---------|
| Out1               | float64 |
| Out2               | float64 |
| Out3               | float64 |
| Out4               | float64 |

## Block: Sin2Limiter

---

Limitation of rising and falling rate with  $\sin^2$  characteristic.

Note: A running limitation process can not be interrupted!

Function of Enable:

0: rate limiting disabled, signal is set to zero

1: rate limiting enabled, signal is rate limited

0->1: preload of output with value from init input

| Inports |                                                                                                                                                                                           |

| Tr              | 1  | Rising time in seconds. Slew rate will be $1/Tr$                |
| Tf              | 2  | Falling time in seconds. Slew rate will be $1/Tf$               |
| ts_fact         | 3  | Multiplication factor of base sampling time (in integer format) |

### Description:

Rising and falling time refer to a step from 0 to 1. Entries for *Tr*: *Rising time* and *Tf*: *Falling time* smaller than the actual sample time will be limited to the sample time internally.

## Block: Sin3Gen

Generation of a 3 sine waves with amplitude (A) and frequency (f).

| Inports |           |
|---------|-----------|
| A       | Amplitude |
| f       | Frequency |

| Outputs |                          |
|---------|--------------------------|
| u       | Sine wave output phase u |
| v       | Sine wave output phase v |
| w       | Sine wave output phase w |

| Mask Parameters |    |                                                                 |
|-----------------|----|-----------------------------------------------------------------|
| Name            | ID | Description                                                     |
| fmax            | 1  | Maximum Frequency in Hz                                         |
| Offset          | 2  | Offset                                                          |
| ts_fact         | 3  | Multiplication factor of base sampling time (in integer format) |

### Description:

Calculation fixed point implementation:

$$\begin{aligned}
 u_k &= A_k \sin(2f_k f_{\max} kT_s) + A_{\text{offset}} \\
 v_k &= A_k \sin\left(2f_k f_{\max} kT_s - \frac{2\pi}{3}\right) + A_{\text{offset}} \\
 w_k &= A_k \sin\left(2f_k f_{\max} kT_s + \frac{2\pi}{3}\right) + A_{\text{offset}}
 \end{aligned}$$

For sine calculation a lookup table with 256 entries is used. This results in a short computation time but with the downside of reduced accuracy for the FiP32 implementation.

Calculation floating point implementation (parameter  $f_{\max}$  is ignored):

$$\begin{aligned}
 u_k &= A_k \sin(2\pi f_k kT_s) + A_{\text{offset}} \\
 v_k &= A_k \sin\left(2\pi f_k kT_s - \frac{2\pi}{3}\right) + A_{\text{offset}} \\
 w_k &= A_k \sin\left(2\pi f_k kT_s + \frac{2\pi}{3}\right) + A_{\text{offset}}
 \end{aligned}$$

**Implementations:**

## Block: SinGen

---

Generation of a sine wave with amplitude (A) and frequency (f).

| Inports |           |
|---------|-----------|
| A       | Amplitude |
| f       | Frequency |

| Outputs |                  |
|---------|------------------|
| u       | Sine wave output |

| Mask Parameters |    |                                                                 |
|-----------------|----|-----------------------------------------------------------------|
| Name            | ID | Description                                                     |
| fmax            | 1  | Maximum Frequency in Hz                                         |
| Offset          | 2  | Offset                                                          |
| Phase           | 3  | Phase [-Pi..Pi]                                                 |
| ts_fact         | 4  | Multiplication factor of base sampling time (in integer format) |

### Description:

Calculation fixed point implementation:

$$u_k = A_k \sin(2f_k f_{\max} kT_s + \phi_{\text{phase}}) + A_{\text{offset}}$$

For sine calculation a lookup table with 256 entries is used. This results in a short computation time but with the downside of reduced accuracy for the FiP32 implementation.

Calculation floating point implementation (parameter  $f_{\max}$  is ignored):

$$u_k = A_k \sin(2\pi f_k kT_s + \phi_{\text{phase}}) + A_{\text{offset}}$$

### Implementations:

|                |                                      |
|----------------|--------------------------------------|
| <b>FiP16</b>   | 16 Bit Fixed Point Implementation    |
| <b>FiP32</b>   | 32 Bit Fixed Point Implementation    |
| <b>Float32</b> | 32 Bit Floating Point Implementation |
| <b>Float64</b> | 64 Bit Floating Point Implementation |

### Implementation: FiP16

---

16 Bit Fixed Point Implementation

| Inports Data Type |       |
|-------------------|-------|

### Implementations:

|                   |                                              |
|-------------------|----------------------------------------------|
| <b>FiP8_16</b>    | 8 to 16 Bit Fixed Point Implementation       |
| <b>FiP8_32</b>    | 8 to 32 Bit Fixed Point Implementation       |
| <b>FiP16_8</b>    | 16 to 8 Bit Fixed Point Implementation       |
| <b>FiP16_32</b>   | 16 to 32 Bit Fixed Point Implementation      |
| <b>FiP32_8</b>    | 32 to 8 Bit Fixed Point Implementation       |
| <b>FiP32_16</b>   | 32 to 16 Bit Fixed Point Implementation      |
| <b>Bool_FiP16</b> | Boolean to 16 Bit Fixed Point Implementation |
| <b>Bool_FiP32</b> | Boolean to 32 Bit Fixed Point Implementation |
| <b>FiP16_Bool</b> | 16 Bit Fixed Point to Boolean Implementation |
| <b>FiP32_Bool</b> | 32 Bit Fixed Point to Boolean Implementation |

### Implementation: FiP8\_16

8 to 16 Bit Fixed Point Implementation

| Inports Data Type |      |
|-------------------|------|
| In                | int8 |

| Outports Data Type |       |
|--------------------|-------|
| Out                | int16 |

### Implementation: FiP8\_32

8 to 32 Bit Fixed Point Implementation

| Inports Data Type |      |
|-------------------|------|
| In                | int8 |

| Outports Data Type |       |
|--------------------|-------|
| Out                | int32 |

### Implementation: FiP16\_8

16 to 8 Bit Fixed Point Implementation

| Inports Data Type |       |
|-------------------|-------|
| In                | int16 |

| Outports Data Type |      |
|--------------------|------|
| Out                | int8 |

### Implementation: FiP16\_32

16 to 32 Bit Fixed Point Implementation

| Inports Data Type |       |
|-------------------|-------|
| In                | int16 |

| Outports Data Type |       |
|--------------------|-------|
| Out                | int32 |

### Implementation: FiP32\_8

32 to 8 Bit Fixed Point Implementation

| Inports Data Type |       |
|-------------------|-------|
| In                | int32 |

| Outports Data Type |      |
|--------------------|------|
| Out                | int8 |

### Implementation: FiP32\_16

32 to 16 Bit Fixed Point Implementation

| Inports Data Type |       |
|-------------------|-------|
| In                | int32 |

| Outports Data Type |       |
|--------------------|-------|
| Out                | int16 |

### Implementation: Bool\_FiP16

Boolean to 16 Bit Fixed Point Implementation

| Inports Data Type |      |
|-------------------|------|
| In                | bool |

| Outports Data Type |       |
|--------------------|-------|
| Out                | int16 |

### Implementation: Bool\_FiP32

Boolean to 32 Bit Fixed Point Implementation

| Inports Data Type |      |
|-------------------|------|
| In                | bool |

| Outports Data Type |       |
|--------------------|-------|
| Out                | int32 |

### Implementation: FiP16\_Bool

16 Bit Fixed Point to Boolean Implementation

| Inports Data Type |       |
|-------------------|-------|
| In                | int16 |

| Outports Data Type |      |
|--------------------|------|
| Out                | bool |

### Implementation: FiP32\_Bool

32 Bit Fixed Point to Boolean Implementation

| Inports Data Type |       |
|-------------------|-------|
| In                | int32 |

| Outports Data Type |      |
|--------------------|------|
| Out                | bool |
